# 1. Overview

ESP32 is a single 2.4 GHz Wi-Fi and Bluetooth combo chip designed with TSMC ultra-low-power 40 nm technology. It is designed to achieve the best power and RF performance, showing robustness, versatility and reliability in a wide variety of applications and different power profiles.

The ESP32 series of chips include ESP32-D0WDQ6, ESP32-D0WD, ESP32-D2WD, and ESP32-S0WD. For details on part numbers and ordering information, please refer to [Part Number and Ordering Information](#).

## 1.1 Featured Solutions

### 1.1.1 Ultra-Low-Power Solution

ESP32 is designed for mobile, wearable electronics, and Internet-of-Things (IoT) applications. It features all the state-of-the-art characteristics of low-power chips, including fine-grained clock gating, multiple power modes, and dynamic power scaling. For instance, in a low-power IoT sensor hub application scenario, ESP32 is woken up periodically and only when a specified condition is detected. Low duty cycle is used to minimize the amount of energy that the chip expends. The output of the power amplifier is also adjustable, thus contributing to an optimal trade-off between communication range, data rate and power consumption.

**Note:**

For more information, refer to Section 3.7 RTC and Low-Power Management.

### 1.1.2 Complete Integration Solution

ESP32 is a highly-integrated solution for Wi-Fi and Bluetooth IoT applications, with around 20 external components. ESP32 integrates an antenna switch, RF balun, power amplifier, low-noise receive amplifier, filters, and power management modules. As such, the entire solution occupies minimal Printed Circuit Board (PCB) area.

ESP32 uses CMOS for single-chip fully-integrated radio and baseband, and also integrates advanced calibration circuitries that allow the solution to dynamically adjust itself and remove external circuit imperfections, or adjust to changes in external conditions. As such, the mass production of ESP32 solutions does not require expensive and specialized Wi-Fi testing equipment.

## 1.2 Wi-Fi Key Features

- 802.11 b/g/n/e/i
- 802.11 n (2.4 GHz), up to 150 Mbps
- 802.11 e: QoS for wireless multimedia technology
- WMM-PS, UAPSD
- A-MPDU and A-MSDU aggregation
- Block ACK
- Fragmentation and defragmentation
- Automatic Beacon monitoring/scanning

- 802.11 i security features: pre-authentication and TSN
- Wi-Fi Protected Access (WPA)/WPA2/WPA2-Enterprise/Wi-Fi Protected Setup (WPS)
- Infrastructure BSS Station mode/SoftAP mode
- Wi-Fi Direct (P2P), P2P Discovery, P2P Group Owner mode and P2P Power Management
- UMA compliant and certified
- Antenna diversity and selection

**Note:**

For more information, please refer to Section [3.5 Wi-Fi](#).

### 1.3 BT Key Features

- Compliant with Bluetooth v4.2 BR/EDR and BLE specification
- Class-1, class-2 and class-3 transmitter without external power amplifier
- Enhanced power control
- +12 dBm transmitting power
- NZIF receiver with -97 dBm sensitivity
- Adaptive Frequency Hopping (AFH)
- Standard HCI based on SDIO/SPI/UART
- High-speed UART HCI, up to 4 Mbps
- BT 4.2 controller and host stack
- Service Discover Protocol (SDP)
- General Access Profile (GAP)
- Security Manage Protocol (SMP)
- ATT/GATT
- HID
- All GATT-based profile supported
- SPP-like GATT-based profile
- BLE Beacon
- A2DP/AVRCP/SPP, HSP/HFP, RFCOMM
- CVSD and SBC for audio codec
- Bluetooth Piconet and Scatternet

## 1.4 MCU and Advanced Features

### 1.4.1 CPU and Memory

- Xtensa® single-/dual-core 32-bit LX6 microprocessor(s), up to 600 DMIPS (200 DMIPS for single-core microprocessor)
- 448 kB ROM
- 520 kB SRAM
- 16 kB SRAM in RTC
- QSPI flash/SRAM, up to 4 x 16 MB
- Power supply: 2.3V to 3.6V

### 1.4.2 Clocks and Timers

- Internal 8 MHz oscillator with calibration
- Internal RC oscillator with calibration
- External 2 MHz to 60 MHz crystal oscillator (40 MHz only for Wi-Fi/BT functionality)
- External 32 kHz crystal oscillator for RTC with calibration
- Two timer groups, including 2 x 64-bit timers and 1 x main watchdog in each group
- RTC timer with sub-second accuracy
- RTC watchdog

### 1.4.3 Advanced Peripheral Interfaces

- 12-bit SAR ADC up to 18 channels
- 2 x 8-bit DAC
- 10 x touch sensors
- Temperature sensor
- 4 x SPI
- 2 x I2S
- 2 x I2C
- 3 x UART
- 1 host (SD/eMMC/SDIO)
- 1 slave (SDIO/SPI)
- Ethernet MAC interface with dedicated DMA and IEEE 1588 support
- CAN 2.0
- IR (TX/RX)
- Motor PWM
- LED PWM up to 16 channels
- Hall sensor

- Ultra-low-noise analog pre-amplifier

#### 1.4.4 Security

- IEEE 802.11 standard security features are all supported, including WPA, WPA/WPA2 and WAPI
- Secure boot
- Flash encryption
- 1024-bit OTP, up to 768-bit for customers
- Cryptographic hardware acceleration:
  - AES
  - HASH (SHA-2) library
  - RSA
  - ECC
  - Random Number Generator (RNG)

#### 1.4.5 Development Support

- SDK firmware for fast online programming
- Open-source toolchains based on GCC

**Note:**

For more information, please refer to [Learning Resources](#).

### 1.5 Applications

- Generic low-power IoT sensor hub
- Generic low-power IoT loggers
- Video streaming from camera
- Over The Top (OTT) devices
- Music players
  - Internet music players
  - Audio streaming devices
- Wi-Fi-enabled toys
  - Loggers
  - Proximity sensing toys
- Wi-Fi-enabled speech recognition devices
- Audio headsets
- Smart power plugs
- Home automation

- Mesh network
- Industrial wireless control
- Baby monitors
- Wearable electronics
- Wi-Fi location-aware devices
- Security ID tags
- Healthcare
  - Proximity and movement-monitoring trigger devices
  - Temperature-sensing loggers

SENSOR_CAPP	6	I	GPIO37, ADC_PRE_AMP, ADC1_CH1, RTC_GPIO1 Note: Connects a 270 pF capacitor from SENSOR_VP to SENSOR_CAPP when used as ADC_PRE_AMP.
SENSOR_CAPN	7	I	GPIO38, ADC1_CH2, ADC_PRE_AMP, RTC_GPIO2 Note: Connects a 270 pF capacitor from SENSOR_VN to SENSOR_CAPN when used as ADC_PRE_AMP.
SENSOR_VN	8	I	GPIO39, ADC1_CH3, ADC_PRE_AMP, RTC_GPIO3 Note: Connects a 270 pF capacitor from SENSOR_VN to SENSOR_CAPN when used as ADC_PRE_AMP.
CHIP_PU	9	I	High: On; enables the chip Low: Off; resets the chip Note: Do not leave the CHIP_PU pin floating.
VDET_1	10	I	GPIO34, ADC1_CH6, RTC_GPIO4
VDET_2	11	I	GPIO35, ADC1_CH7, RTC_GPIO5
32K_XP	12	I/O	GPIO32, 32K_XP (32.768 kHz crystal oscillator input), ADC1_CH4, TOUCH9, RTC_GPIO9
32K_XN	13	I/O	GPIO33, 32K_XN (32.768 kHz crystal oscillator output), ADC1_CH5, TOUCH8, RTC_GPIO8
GPIO25	14	I/O	GPIO25, DAC_1, ADC2_CH8, RTC_GPIO6, EMAC_RXD0
GPIO26	15	I/O	GPIO26, DAC_2, ADC2_CH9, RTC_GPIO7, EMAC_RXD1
GPIO27	16	I/O	GPIO27, ADC2_CH7, TOUCH7, RTC_GPIO17, EMAC_RX_DV
MTMS	17	I/O	GPIO14, ADC2_CH6, TOUCH6, RTC_GPIO16, MTMS, HSPI-CLK, HS2_CLK, SD_CLK, EMAC_TXD2
MTDI	18	I/O	GPIO12, ADC2_CH5, TOUCH5, RTC_GPIO15, MTDI, HSPIQ, HS2_DATA2, SD_DATA2, EMAC_TXD3
VDD3P3_RTC	19	P	Input power supply for RTC IO (1.8V ~ 3.6V)
MTCK	20	I/O	GPIO13, ADC2_CH4, TOUCH4, RTC_GPIO14, MTCK, HSPID, HS2_DATA3, SD_DATA3, EMAC_RX_ER
MTDO	21	I/O	GPIO15, ADC2_CH3, TOUCH3, RTC_GPIO13, MTDO, HSPICS0, HS2_CMD, SD_CMD, EMAC_RXD3
GPIO2	22	I/O	GPIO2, ADC2_CH2, TOUCH2, RTC_GPIO12, HSPiWP, HS2_DATA0, SD_DATA0
GPIO0	23	I/O	GPIO0, ADC2_CH1, TOUCH1, RTC_GPIO11, CLK_OUT1, EMAC_TX_CLK
GPIO4	24	I/O	GPIO4, ADC2_CH0, TOUCH0, RTC_GPIO10, HSPiHD, HS2_DATA1, SD_DATA1, EMAC_TX_ER
VDD_SDIO			
GPIO16	25	I/O	GPIO16, HS1_DATA4, U2RXD, EMAC_CLK_OUT
VDD_SDIO	26	P	Output power supply: 1.8V or the same voltage as VDD3P3_RTC
GPIO17	27	I/O	GPIO17, HS1_DATA5, U2TXD, EMAC_CLK_OUT_180
SD_DATA_2	28	I/O	GPIO9, SD_DATA2, SPIHD, HS1_DATA2, U1RXD
SD_DATA_3	29	I/O	GPIO10, SD_DATA3, SPiWP, HS1_DATA3, U1TXD
SD_CMD	30	I/O	GPIO11, SD_CMD, SPiCS0, HS1_CMD, U1RTS
SD_CLK	31	I/O	GPIO6, SD_CLK, SPiCLK, HS1_CLK, U1CTS

Name	No.	Type	Function
SD_DATA_0	32	I/O	GPIO7, SD_DATA0, SPIQ, HS1_DATA0, U2RTS
SD_DATA_1	33	I/O	GPIO8, SD_DATA1, SPID, HS1_DATA1, U2CTS
VDD3P3_CPU			
GPIO5	34	I/O	GPIO5, VSPICS0, HS1_DATA6, EMAC_RX_CLK
GPIO18	35	I/O	GPIO18, VSPICLK, HS1_DATA7
GPIO23	36	I/O	GPIO23, VSPID, HS1_STROBE
VDD3P3_CPU	37	P	Input power supply for CPU IO (1.8V ~ 3.6V)
GPIO19	38	I/O	GPIO19, VSPIQ, U0CTS, EMAC_TXD0
GPIO22	39	I/O	GPIO22, VSPIWP, U0RTS, EMAC_TXD1
U0RXD	40	I/O	GPIO3, U0RXD, CLK_OUT2
U0TXD	41	I/O	GPIO1, U0TXD, CLK_OUT3, EMAC_RXD2
GPIO21	42	I/O	GPIO21, VSPiHD, EMAC_TX_EN
Analog			
VDDA	43	P	Analog power supply (2.3V ~ 3.6V)
XTAL_N	44	O	External crystal output
XTAL_P	45	I	External crystal input
VDDA	46	P	Digital power supply for PLL (2.3V ~ 3.6V)
CAP2	47	I	Connects to a 3 nF capacitor and 20 k $\Omega$ resistor in parallel to CAP1
CAP1	48	I	Connects to a 10 nF series capacitor to ground
GND	49	P	Ground

**Note:**

- ESP32-D2WD's pins GPIO16, GPIO17, SD\_CMD, SD\_CLK, SD\_DATA\_0 and SD\_DATA\_1 are used for connecting the embedded flash, and are not recommended for other uses.
- For a quick reference guide to using the IO\_MUX, Ethernet MAC, and GPIO Matrix pins of ESP32, please refer to Appendix [ESP32 Pin Lists](#).
- In most cases, the data port connection between the ESP32 and external flash is as follows: SD\_DATA0/SPIQ = IO1/DO, SD\_DATA1/SPID = IO0/DI, SD\_DATA2/SPIHD = IO3/HOLD, SD\_DATA3/SPIWP = IO2/WP.

## 2.3 Power Scheme

ESP32's digital pins are divided into three different power domains:

- VDD3P3\_RTC
- VDD3P3\_CPU
- VDD\_SDIO

VDD3P3\_RTC is also the input power supply for RTC and CPU.

VDD3P3\_CPU is also the input power supply for CPU.

VDD\_SDIO connects to the output of an internal LDO whose input is VDD3P3\_RTC. When VDD\_SDIO is connected to the same PCB net together with VDD3P3\_RTC, the internal LDO is disabled automatically.

The internal LDO can be configured as having 1.8V, or the same voltage as VDD3P3\_RTC. It can be powered off via software to minimize the current of flash/SRAM during the Deep-sleep mode.

**Note:**

- CHIP\_PU must be activated after the 3.3V rails have been brought up. The recommended delay time (T) is given by the parameter of the RC circuit. For the reference design, please see Figure **ESP-WROOM-32 Peripheral Schematics** in [ESP-WROOM-32 Datasheet](#).
- CHIP\_PU is used to reset the chip. The input level for resetting the chip should be below 0.6V and remain so for at least 200  $\mu$ s.
- In scenarios where ESP32 is powered on and off repeatedly by switching the power rails, while there is a large capacitor on the VDD33 rail, simply switching off the VDD33 power rail and immediately switching it back on may cause an incomplete power discharge cycle and failure to reset the chip adequately.  
An additional discharge circuit may be required to accelerate the discharge of the large capacitor on VDD33 rail to ensure proper power-on-reset when the ESP32 is powered up again. Please find the discharge circuit in Figure **ESP-WROOM-32 Peripheral Schematics**, in [ESP-WROOM-32 Datasheet](#).
- The operating voltage of ESP32 ranges from 2.3V to 3.6V. When using a single-power supply, the recommended voltage of the power supply is 3.3V, and its recommended output current is 500 mA or more.

## 2.4 Strapping Pins

ESP32 has five strapping pins:

- MTDI
- GPIO0
- GPIO2
- MTDO
- GPIO5

Software can read the value of these five bits from register "GPIO\_STRAPPING".

During the chip's system reset (power-on reset, RTC watchdog reset and brownout reset), the latches of the strapping pins sample the voltage level as strapping bits of "0" or "1", and hold these bits until the chip is powered down or shut down. The strapping bits configure the device's boot mode, the operating voltage of VDD\_SDIO and other initial system settings.

Each strapping pin is connected to its internal pull-up/pull-down during the chip reset. Consequently, if a strapping pin is unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of the strapping pins.

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or apply the host MCU's GPIOs to control the voltage level of these pins when powering on ESP32.

After reset, the strapping pins work as normal-function pins.

Refer to Table 3 for a detailed boot modes' configuration by strapping pins.

**Table 3: Strapping Pins**

**Note:**

- Firmware can configure register bits to change the setting of "Voltage of Internal LDO (VDD\_SDIO)" and "Timing of SDIO Slave" after bootling.
- The embedded flash operates at 1.8V. For the ESP32 series of chips that contain embedded flash, the MTDI should be pulled high.

## 3. Functional Description

This chapter describes the functions integrated in ESP32.

### 3.1 CPU and Memory

#### 3.1.1 CPU

ESP32 contains one or two low-power Xtensa® 32-bit LX6 microprocessor(s) with the following features:

- 7-stage pipeline to support the clock frequency of up to 240 MHz (160 MHz for ESP32-S0WD)
- 16/24-bit Instruction Set provides high code-density
- Support for Floating Point Unit
- Support for DSP instructions, such as 32-bit multiplier, 32-bit divider, and 40-bit MAC
- Support for 32 interrupt vectors from about 70 interrupt sources

The single-/dual-CPU interfaces include:

- Xtensa RAM/ROM Interface for instructions and data
- Xtensa Local Memory Interface for fast peripheral register access
- External and internal interrupt sources
- JTAG for debugging

#### 3.1.2 Internal Memory

ESP32's internal memory includes:

- 448 kB of ROM for booting and core functions.
- 520 kB (8 kB RTC FAST Memory included) of on-chip SRAM for data and instructions.
  - 8 kB of SRAM in RTC, which is called RTC FAST Memory and can be used for data storage; it is accessed by the main CPU during RTC Boot from the Deep-sleep mode.
- 8 kB of SRAM in RTC, which is called RTC SLOW Memory and can be accessed by the co-processor during the Deep-sleep mode.
- 1 kbit of eFuse, of which 256 bits are used for the system (MAC address and chip configuration) and the remaining 768 bits are reserved for customer applications, including Flash-Encryption and Chip-ID.
- Embedded flash

**Note:**

- Products in the ESP32 series differ from each other, in terms of their support for embedded flash and the size of it. For details, please refer to [Part Number and Ordering Information](#).
- From the ESP32 series of chips specified in this document, ESP32-D2WD has 16 Mbits of embedded flash, connected via pins GPIO16, GPIO17, SD\_CMD, SD\_CLK, SD\_DATA\_0 and SD\_DATA\_1. The other chips in the ESP32 series have no embedded flash.

### 3.1.3 External Flash and SRAM

ESP32 supports up to four 16-MB external QSPI flashes and SRAMs with hardware encryption based on AES to protect developers' programs and data.

ESP32 can access the external QSPI flash and SRAM through high-speed caches.

- Up to 16 MB of external flash are memory-mapped onto the CPU code space, supporting 8-bit, 16-bit and 32-bit access. Code execution is supported.
- Up to 8 MB of external flash/SRAM memory are mapped onto the CPU data space, supporting 8-bit, 16-bit and 32-bit access. Data-read is supported on the flash and SRAM. Data-write is supported on the SRAM.

**Note:**  
ESP32 chips with embedded flash do not support the address mapping between external flash and peripherals.

### 3.1.4 Memory Map

The structure of address mapping is shown in Figure 4. The memory and peripherals' mapping of ESP32 is shown in Table 4.

## 3.2 Timers and Watchdogs

### 3.2.1 64-bit Timers

There are four general-purpose timers embedded in the ESP32. They are all 64-bit generic timers which are based on 16-bit prescalers and 64-bit auto-reload-capable up/downcounters.

The timers feature:

- A 16-bit clock prescaler, from 2 to 65536
- A 64-bit time-base counter
- Configurable up/down time-base counter: incrementing or decrementing
- Halt and resume of time-base counter
- Auto-reload at alarming
- Software-controlled instant reload
- Level and edge interrupt generation

### 3.2.2 Watchdog Timers

The ESP32 has three watchdog timers: one in each of the two timer modules (called the Main Watchdog Timer, or MWDT) and one in the RTC module (called the RTC Watchdog Timer, or RWDT). These watchdog timers are intended to recover from an unforeseen fault, causing the application program to abandon its normal sequence. A watchdog timer has four stages. Each stage may take one of three or four actions upon the expiry of its programmed time period, unless the watchdog is fed or disabled. The actions are: interrupt, CPU reset, core reset, and system reset. Only the RWDT can trigger the system reset, and is able to reset the entire chip, including the RTC itself. A timeout value can be set for each stage individually.

During flash boot the RWDT and the first MWDT start automatically in order to detect, and recover from, booting problems.

The ESP32 watchdogs have the following features:

- four stages, each of which can be configured or disabled separately

- Programmable time period for each stage
- One of three or four possible actions (interrupt, CPU reset, core reset, and system reset) upon the expiry of each stage
- 32-bit expiry counter
- Write protection to prevent the RWDT and MWDT configuration from being inadvertently altered
- SPI flash boot protection  
If the boot process from an SPI flash does not complete within a predetermined time period, the watchdog will reboot the entire system.

## 3.3 System Clocks

### 3.3.1 CPU Clock

Upon reset, an external crystal clock source is selected as the default CPU clock. The external crystal clock source also connects to a PLL to generate a high-frequency clock (typically 160 MHz).

In addition, ESP32 has an internal 8 MHz oscillator. The accuracy of the oscillator is guaranteed by design and is stable within the operating temperatures (with a margin error of 1%). Hence, the application can then select the clock source from the external crystal clock source, the PLL clock or the internal 8 MHz oscillator. The selected clock source drives the CPU clock, directly or after division, depending on the application.

### 3.3.2 RTC Clock

The RTC clock has five possible sources:

- external low-speed (32 kHz) crystal clock
- external crystal clock divided by 4
- internal RC oscillator (typically about 150 kHz, and adjustable)
- internal 8 MHz oscillator
- internal 31.25 kHz clock (derived from the internal 8 MHz oscillator divided by 256)

When the chip is in the normal power mode and needs faster CPU accessing, the application can choose the external high-speed crystal clock divided by 4 or the internal 8 MHz oscillator. When the chip operates in the low-power mode, the application chooses the external low-speed (32 kHz) crystal clock, the internal RC clock or the internal 31.25 kHz clock.

### 3.3.3 Audio PLL Clock

The audio clock is generated by the ultra-low-noise fractional-N PLL. More details can be found in the [ESP32 Technical Reference Manual](#), in Chapter Reset and Clock.

## 3.4 Radio

The ESP32 radio consists of the following blocks:

- 2.4 GHz receiver
- 2.4 GHz transmitter

- bias and regulators
- balun and transmit-receive switch
- clock generator

#### 3.4.1 2.4 GHz Receiver

The 2.4 GHz receiver down-converts the 2.4 GHz RF signal to quadrature baseband signals and converts them to the digital domain with two high-resolution, high-speed ADCs. To adapt to varying signal channel conditions, RF filters, Automatic Gain Control (AGC), DC offset cancellation circuits and baseband filters are integrated with ESP32.

#### 3.4.2 2.4 GHz Transmitter

The 2.4 GHz transmitter up-converts the quadrature baseband signals to the 2.4 GHz RF signal, and drives the antenna with a high-powered Complementary Metal Oxide Semiconductor (CMOS) power amplifier. The use of digital calibration further improves the linearity of the power amplifier, enabling state-of-the-art performance in delivering +20.5 dBm of average power for an 802.11b transmission and +17 dBm for an 802.11n transmission.

Additional calibrations are integrated to cancel any radio imperfections, such as:

- Carrier leakage
- I/Q phase matching
- Baseband nonlinearities
- RF nonlinearities
- Antenna matching

These built-in calibration routines reduce the amount of time required for product testing, and render the testing equipment unnecessary.

#### 3.4.3 Clock Generator

The clock generator produces a quadrature 2.4 GHz clock signals for the receiver and transmitter. All components of the clock generator are integrated into the chip, including all inductors, varactors, filters, regulators and dividers.

The clock generator has built-in calibration and self-test circuits. Quadrature clock phases and phase noise are optimized on-chip with patented calibration algorithms which ensure the best performance of the receiver and transmitter.

### 3.5 Wi-Fi

ESP32 implements TCP/IP, full 802.11 b/g/n/e/i WLAN MAC protocol, and Wi-Fi Direct specification. It supports Basic Service Set (BSS) STA, SoftAP operations under the Distributed Control Function (DCF), and P2P group operation that is compliant with the latest Wi-Fi P2P protocol.

Passive or active scanning, as well as the P2P discovery procedure, are performed autonomously when initiated with appropriate commands. Power management is handled with minimum host interaction to minimize active-duty period.

### 3.5.1 Wi-Fi Radio and Baseband

The ESP32 Wi-Fi Radio and Baseband support the following features:

- 802.11b and 802.11g data rates
- 802.11n MCS0-7 in both 20 MHz and 40 MHz bandwidth
- 802.11n MCS32 (Rx)
- 802.11n 0.4  $\mu$ s guard-interval
- up to 150 Mbps of data rate
- Receiving STBC 2x1
- Up to 20.5 dBm of transmitting power
- Adjustable transmitting power
- Antenna diversity and selection

ESP32 supports antenna diversity with an external RF switch. One GPIO controls the RF switch and selects the best antenna to minimize the effects of channel fading.

### 3.5.2 Wi-Fi MAC

The ESP32 Wi-Fi MAC applies low-level protocol functions automatically, as follows:

- Request To Send (RTS), Clear To Send (CTS) and Acknowledgement (ACK/BA)
- Fragmentation and defragmentation
- Aggregation AMPDU and AMSDU
- WMM, U-APSD
- 802.11 e: QoS for wireless multimedia technology
- CCMP (CBC-MAC, counter mode), TKIP (MIC, RC4), WAPI (SMS4), WEP (RC4) and CRC
- Frame encapsulation (802.11h/RFC 1042)
- Automatic beacon monitoring/scanning

### 3.5.3 Wi-Fi Firmware

The ESP32 Wi-Fi Firmware provides the following functions:

- Infrastructure BSS Station mode / P2P mode / SoftAP mode support
- P2P Discovery, P2P Group Owner, P2P Group Client and P2P Power Management
- WPA/WPA2-Enterprise and WPS driver
- Additional 802.11i security features, such as pre-authentication and TSN
- Open interface for various upper-layer authentication schemes over EAP, such as TLS, PEAP, LEAP, SIM, AKA, or customer-specific schemes
- Clock/power-gating combined with 802.11-compliant power-management dynamically adapted to current connection conditions, providing minimal power consumption
- Adaptive rate fallback algorithm, which sets the optimal transmission rate and transmits power, based on actual Signal Noise Ratio (SNR) and packet loss information

- Automatic retransmission and response on MAC to avoid packet discarding on a slow host environment

### 3.5.4 Packet Traffic Arbitration (PTA)

ESP32 has a configurable Packet Traffic Arbitration (PTA) that provides flexible and exact timing Bluetooth co-existence support. It is a combination of both Frequency Division Multiplexing (FDM) and Time Division Multiplexing (TDM), which coordinates the protocol stacks.

## 3.6 Bluetooth

ESP32 integrates a Bluetooth link controller and Bluetooth baseband, which carry out the baseband protocols and other low-level link routines, such as modulation/demodulation, packets processing, bit stream processing, frequency hopping, etc.

### 3.6.1 Bluetooth Radio and Baseband

The ESP32 Bluetooth Radio and Baseband support the following features:

- Class-1, class-2 and class-3 transmit output powers, and a dynamic control range of up to 24 dB
- $\pi/4$  DQPSK and 8 DPSK modulation
- High performance in NZIF receiver sensitivity with over 97 dB of dynamic range
- Class-1 operation without external PA
- Internal SRAM allows full-speed data-transfer, mixed voice and data, and full piconet operation
- Logic for forward error correction, header error control, access code correlation, CRC, demodulation, encryption bit stream generation, whitening and transmit pulse shaping
- ACL, SCO, eSCO and AFH
- A-law,  $\mu$ -law and CVSD digital audio CODEC in PCM interface
- SBC audio CODEC
- Power management for low-power applications
- SMP with 128-bit AES

### 3.6.2 Bluetooth Interface

- Provides UART HCI interface, up to 4 Mbps
- Provides SDIO / SPI HCI interface
- Provides I2C interface for the host to do configuration
- Provides PCM / I2S audio interface

### 3.6.3 Bluetooth Stack

The Bluetooth stack of ESP32 is compliant with Bluetooth v4.2 BR / EDR and BLE specification.

### 3.6.4 Bluetooth Link Controller

The link controller operates in three major states: standby, connection and sniff. It enables multiple connections, and other operations, such as inquiry, page, and secure simple-pairing, and therefore enables Piconet and Scatternet. Below are the features:

- Classic Bluetooth
  - Device Discovery (inquiry, and inquiry scan)
  - Connection establishment (page, and page scan)
  - Multi-connections
  - Asynchronous data reception and transmission
  - Synchronous links (SCO/eSCO)
  - Master/Slave Switch
  - Adaptive Frequency Hopping and Channel assessment
  - Broadcast encryption
  - Authentication and encryption
  - Secure Simple-Pairing
  - Multi-point and scatternet management
  - Sniff mode
  - Connectionless Slave Broadcast (transmitter and receiver)
  - Enhanced power control
  - Ping
- Bluetooth Low Energy
  - Advertising
  - Scanning
  - Multiple connections
  - Asynchronous data reception and transmission
  - Adaptive Frequency Hopping and Channel assessment
  - Connection parameter update
  - Data Length Extension
  - Link Layer Encryption
  - LE Ping

### 3.7 RTC and Low-Power Management

With the use of advanced power-management technologies, ESP32 can switch between different power modes (see Table 5).

- Power modes
  - Active mode: The chip radio is powered on. The chip can receive, transmit, or listen.

- Modem-sleep mode: The CPU is operational and the clock is configurable. The Wi-Fi/Bluetooth baseband and radio are disabled.
  - Light-sleep mode: The CPU is paused. The RTC memory and RTC peripherals, as well as the ULP co-processor are running. Any wake-up events (MAC, host, RTC timer, or external interrupts) will wake up the chip.
  - Deep-sleep mode: Only RTC memory and RTC peripherals are powered on. Wi-Fi and Bluetooth connection data are stored in RTC memory. The ULP co-processor can work.
  - Hibernation mode: The internal 8-MHz oscillator and ULP co-processor are disabled. The RTC recovery memory is powered down. Only one RTC timer on the slow clock and some RTC GPIOs are active. The RTC timer or the RTC GPIOs can wake up the chip from the Hibernation mode.
- Sleep Patterns
    - Association sleep pattern: The power mode switches between the Active mode, Modem- and Light-sleep mode, during this sleep pattern. The CPU, Wi-Fi, Bluetooth, and radio are woken up at predetermined intervals to keep Wi-Fi/BT connections alive.
    - ULP sensor-monitored pattern: The main CPU is in the Deep-sleep mode. The ULP co-processor takes sensor measurements and wakes up the main system, based on the data collected from sensors.

**Table 5: Functionalities Depending on the Power Modes**

Power mode	Active	Modem-sleep	Light-sleep	Deep-sleep	Hibernation
Sleep pattern	Association sleep pattern			ULP sensor-monitored pattern	-
CPU	ON	ON	PAUSE	OFF	OFF
Wi-Fi/BT baseband and radio	ON	OFF	OFF	OFF	OFF
RTC memory and RTC peripherals	ON	ON	ON	ON	OFF
ULP co-processor	ON	ON	ON	ON/OFF	OFF

The power consumption varies with different power modes/sleep patterns and work statuses of functional modules. Please see Table 6 for details.

**Table 6: Power Consumption by Power Modes**

Power mode	Description	Power consumption
Active (RF working)	Wi-Fi Tx packet 14 dBm ~ 19.5 dBm	Please refer to Table 10 for details.
	Wi-Fi / BT Tx packet 0 dBm	
	Wi-Fi / BT Rx and listening	
Modem-sleep	The CPU is powered on.	Max speed 240 MHz: 30 mA ~ 50 mA
		Normal speed 80 MHz: 20 mA ~ 25 mA
		Slow speed 2 MHz: 2 mA ~ 4 mA
Light-sleep	-	0.8 mA
Deep-sleep	The ULP co-processor is powered on.	150 $\mu$ A
	ULP sensor-monitored pattern	100 $\mu$ A @1% duty
	RTC timer + RTC memory	10 $\mu$ A
Hibernation	RTC timer only	5 $\mu$ A
Power off	CHIP_PU is set to low level, the chip is powered off	0.1 $\mu$ A

**Note:**

- When Wi-Fi is enabled, the chip switches between Active and Modem-sleep mode. Therefore, power consumption changes accordingly.
- In Modem-sleep mode, the CPU frequency changes automatically. The frequency depends on the CPU load and the peripherals used.
- During Deep-sleep, when the ULP co-processor is powered on, peripherals such as GPIO and I2C are able to operate.
- When the system works in the ULP sensor-monitored pattern, the ULP co-processor works with the ULP sensor periodically and the ADC works with a duty cycle of 1%, so the power consumption is 100  $\mu$ A.

## 4. Peripherals and Sensors

### 4.1 Descriptions of Peripherals and Sensors

#### 4.1.1 General Purpose Input / Output Interface (GPIO)

ESP32 has 34 GPIO pins which can be assigned to various functions by programming the appropriate registers. There are several kinds of GPIOs: digital-only GPIOs, analog-enabled GPIOs, capacitive-touch-enabled GPIOs, etc. Analog-enabled GPIOs can be configured as digital GPIOs. Capacitive-touch-enabled GPIOs can be configured as digital GPIOs.

Most of the digital GPIOs can be configured as internal pull-up or pull-down, or set to high impedance. When configured as an input, the input value can be read through the register. The input can also be set to edge-trigger or level-trigger to generate CPU interrupts. Most of the digital IO pins are bi-directional, non-inverting and tristate, including input and output buffer with tristate control. These pins can be multiplexed with other functions, such as the SDIO interface, UART, SPI, etc. (More details can be found in the Appendix, Table [IO\\_MUX](#).) For low-power operations, the GPIOs can be set to hold their states.

#### 4.1.2 Analog-to-Digital Converter (ADC)

ESP32 integrates 12-bit SAR ADCs and supports measurements on 18 channels (analog-enabled pins). Some of these pins can be used to build a programmable gain amplifier which is used for the measurement of small analog signals. The ULP-coprocessor in ESP32 is also designed to measure the voltages, while operating in the sleep mode, which enables low-power consumption. The CPU can be woken up by a threshold setting and/or via other triggers.

With the appropriate setting, the ADCs and the amplifier can be configured to measure voltage for a maximum of 18 pins.

#### 4.1.3 Ultra-Low-Noise Analog Pre-Amplifier

ESP32 integrates an ultra-low-noise analog pre-amplifier that amplifies the voltage difference between pins `SENSOR_VP` and `SENSOR_VN`, and outputs the value to the ADC. The amplification ratio is given by the size of a pair of sampling capacitors that are placed off-chip. By using a larger capacitor, the sampling noise is reduced, but the settling time will be increased. The amplification ratio is also limited by the amplifier, which peaks at about 60 dB gain.

#### 4.1.4 Hall Sensor

ESP32 integrates a Hall sensor based on an N-carrier resistor. When the chip is in the magnetic field, the Hall sensor develops a small voltage laterally on the resistor, which can be directly measured by the ADC, or amplified by the ultra-low-noise analog pre-amplifier and then measured by the ADC.

#### 4.1.5 Digital-to-Analog Converter (DAC)

Two 8-bit DAC channels can be used to convert two digital signals into two analog voltage signal outputs. The design structure is composed of integrated resistor strings and a buffer. This dual DAC supports power supply as input voltage reference and can drive other circuits. The dual channels support independent conversions.

### 4.1.6 Temperature Sensor

The temperature sensor generates a voltage that varies with temperature. The voltage is internally converted via an analog-to-digital converter into a digital code.

The temperature sensor has a range of -40°C to 125°C. The offset of the temperature sensor varies from chip to chip, due to process variations or the heat generated by the Wi-Fi circuitry itself (which affects measurements). Therefore, the internal temperature sensor is only suitable for applications that detect changes in temperature, rather than absolute temperatures, and for calibration purposes as well.

However, if the user calibrates the temperature sensor and uses the device for an application that uses minimal power, the results could be accurate enough.

### 4.1.7 Touch Sensor

ESP32 has 10 capacitive-sensing GPIOs, which detect variations induced by touching or approaching the GPIOs with a finger or other objects. The low-noise nature of the design and high sensitivity of the circuit allow relatively small pads to be used. Arrays of pads can also be used, so that a larger area or more points can be detected. The 10 capacitive-sensing GPIOs are listed in Table 7.

**Table 7: Capacitive-Sensing GPIOs Available on ESP32**

Capacitive-sensing signal name	Pin name
T0	GPIO4
T1	GPIO0
T2	GPIO2
T3	MTDO
T4	MTCK
T5	MTD1
T6	MTMS
T7	GPIO27
T8	32K_XN
T9	32K_XP

### 4.1.8 Ultra-Lower-Power Coprocessor

The ULP processor and RTC memory remain powered on during the Deep-sleep mode. Hence, the developer can store a program for the ULP processor in the RTC memory to access the peripheral devices, internal timers and internal sensors during the Deep-sleep mode. This is useful for designing applications where the CPU needs to be woken up by an external event, or timer, or a combination of these events, while maintaining minimal power consumption.

### 4.1.9 Ethernet MAC Interface

An IEEE-802.3-2008-compliant Media Access Controller (MAC) is provided for Ethernet LAN communications. ESP32 requires an external physical interface device (PHY) to connect to the physical LAN bus (twisted-pair, fiber, etc.). The PHY is connected to ESP32 through 17 signals of MII or nine signals of RMII. With the Ethernet MAC (EMAC) interface, the following features are supported:

- 10 Mbps and 100 Mbps rates

- Dedicated DMA controller allowing high-speed transfer between the dedicated SRAM and Ethernet MAC
- Tagged MAC frame (VLAN support)
- Half-duplex (CSMA/CD) and full-duplex operation
- MAC control sublayer (control frames)
- 32-bit CRC generation and removal
- Several address-filtering modes for physical and multicast address (multicast and group addresses)
- 32-bit status code for each transmitted or received frame
- Internal FIFOs to buffer transmit and receive frames. The transmit FIFO and the receive FIFO are both 512 words (32-bit)
- Hardware PTP (Precision Time Protocol) in accordance with IEEE 1588 2008 (PTP V2)
- 25 MHz/50 MHz clock output

#### 4.1.10 SD/SDIO/MMC Host Controller

An SD/SDIO/MMC host controller is available on ESP32, which supports the following features:

- Secure Digital memory (SD mem Version 3.0 and Version 3.01)
- Secure Digital I/O (SDIO Version 3.0)
- Consumer Electronics Advanced Transport Architecture (CE-ATA Version 1.1)
- Multimedia Cards (MMC Version 4.41, eMMC Version 4.5 and Version 4.51)

The controller allows up to 80 MHz of clock output in three different data-bus modes: 1-bit, 4-bit and 8-bit. It supports two SD/SDIO/MMC4.41 cards in a 4-bit data-bus mode. It also supports one SD card operating at a 1.8V level.

#### 4.1.11 SDIO/SPI Slave Controller

ESP32 integrates an SD device interface that conforms to the industry-standard SDIO Card Specification Version 2.0, and allows a host controller to access the SoC device using the SDIO bus interface and protocol. ESP32 acts as the slave on the SDIO bus. The host can access SDIO interface registers directly and can access shared memory via a DMA engine, thus maximizing performance without engaging the processor cores.

The SDIO/SPI slave controller supports the following features:

- SPI, 1-bit SDIO, and 4-bit SDIO transfer modes over the full clock range of 0 to 50 MHz
- Configurable sampling and driving clock edge
- Special registers for direct access by host
- Interrupt to host for initiating data transfer
- Automatic loading of SDIO bus data and automatic discarding of padding data
- Block size of up to 512 bytes
- Interrupt vectors between the host and the slave, allowing both to interrupt each other
- Supports DMA for data transfer

### 4.1.12 Universal Asynchronous Receiver Transmitter (UART)

ESP32 has three UART interfaces, i.e. UART0, UART1 and UART2, which provide asynchronous communication (RS232 and RS485) and IrDA support, communicating at a speed of up to 5 Mbps. UART provides hardware management of the CTS and RTS signals and software flow control (XON and XOFF). All of the interfaces can be accessed by the DMA controller or directly by the CPU.

### 4.1.13 I2C Interface

ESP32 has two I2C bus interfaces which can serve as I2C master or slave, depending on the user's configuration. The I2C interfaces support:

- Standard mode (100 kbit/s)
- Fast mode (400 kbit/s)
- Up to 5 MHz, yet constrained by SDA pull-up strength
- 7-bit/10-bit addressing mode
- Dual addressing mode

Users can program command registers to control I2C interfaces, so that they have more flexibility.

### 4.1.14 I2S Interface

Two standard I2S interfaces are available in ESP32. They can be operated in the master or slave mode, in full duplex and half-duplex communication modes, and can be configured to operate with an 8-/16-/32-/40-/48-bit resolution as input or output channels. BCK clock frequency, from 10 kHz up to 40 MHz, is supported. When one or both of the I2S interfaces are configured in the master mode, the master clock can be output to the external DAC/CODEC.

Both of the I2S interfaces have dedicated DMA controllers. PDM and BT PCM interfaces are supported.

### 4.1.15 Infrared Remote Controller

The infrared remote controller supports eight channels of infrared remote transmission and receiving. Through programming the pulse waveform, it supports various infrared protocols. Eight channels share a 512 x 32-bit block of memory to store the transmitting or receiving waveform.

### 4.1.16 Pulse Counter

The pulse counter captures pulse and counts pulse edges through seven modes. It has eight channels, each of whom captures four signals at a time. The four input signals include two pulse signals and two control signals. When the counter reaches a defined threshold, an interrupt is generated.

### 4.1.17 Pulse Width Modulation (PWM)

The Pulse Width Modulation (PWM) controller can be used for driving digital motors and smart lights. The controller consists of PWM timers, the PWM operator and a dedicated capture sub-module. Each timer provides timing in synchronous or independent form, and each PWM operator generates a waveform for one PWM channel. The dedicated capture sub-module can accurately capture events with external timing.

#### 4.1.18 LED PWM

The LED PWM controller can generate 16 independent channels of digital waveforms with configurable periods and duties.

The 16 channels of digital waveforms operate at 80 MHz APB clock, eight of which have the option of using the 8 MHz oscillator clock. Each channel can select a 20-bit timer with configurable counting range, while its accuracy of duty can be up to 16 bits within a 1 ms period.

The software can change the duty immediately. Moreover, each channel supports step-by-step duty increasing or decreasing automatically, which makes it useful for the LED RGB color-gradient generator.

#### 4.1.19 Serial Peripheral Interface (SPI)

ESP32 features three SPIs (SPI, HSPI and VSPI) in slave and master modes in 1-line full-duplex and 1/2/4-line half-duplex communication modes. These SPIs also support the following general-purpose SPI features:

- Four timing modes of the SPI format transfer, which depend on the polarity (POL) and the phase (PHA)
- up to 80 MHz and the divided clocks of 80 MHz
- up to 64-byte FIFO

All SPIs can also be used to connect to the external flash/SRAM and LCD. Each SPI can be served by DMA controllers.

#### 4.1.20 Accelerator

ESP32 is equipped with hardware accelerators of general algorithms, such as AES (FIPS PUB 197), SHA (FIPS PUB 180-4), RSA, and ECC, which support independent arithmetic, such as Big Integer Multiplication and Big Integer Modular Multiplication. The maximum operation length for RSA, ECC, Big Integer Multiply and Big Integer Modular Multiplication is 4,096 bits.

The hardware accelerators greatly improve operation speed and reduce software complexity. They also support code encryption and dynamic decryption, which ensures that codes in the flash will not be stolen.

## 5. Electrical Characteristics

**Note:**

The specifications in this chapter have been tested under the following general condition:  $V_{DD} = 3.3V$ ,  $T_A = 27^{\circ}C$ , unless otherwise specified.

### 5.1 Absolute Maximum Ratings

**Table 9: Absolute Maximum Ratings**

Parameter	Symbol	Min	Typ	Max	Unit
Power supply <sup>1</sup>	VDD	2.3	3.3	3.6	V
Minimum current delivered by power supply	$I_{VDD}$	0.5	-	-	A
Input low voltage	$V_{IL}$	-0.3	-	$0.25 \times V_{IO}^2$	V
Input high voltage	$V_{IH}$	$0.75 \times V_{IO}^2$	-	$V_{IO}^2 + 0.3$	V
Input leakage current	$I_{IL}$	-	-	50	nA
Input pin capacitance	$C_{pad}$	-	-	2	pF
Output low voltage	$V_{OL}$	-	-	$0.1 \times V_{IO}^2$	V
Output high voltage	$V_{OH}$	$0.8 \times V_{IO}^2$	-	-	V
Maximum output drive capability	$I_{MAX}$	-	-	40	mA
Storage temperature range	$T_{STR}$	-40	-	150	$^{\circ}C$
Operating temperature range <sup>3</sup>	$T_{OPR}$	-40	-	125	$^{\circ}C$

1. The power supplies include VDDA, VDD3P3, VDD3P3\_RTC, VDD3P3\_CPU, VDD\_SDIO. The VDD\_SDIO also supports 1.8V mode.
2.  $V_{IO}$  is the power supply for a specific pad. More details can be found in Appendix, Table IO\_MUX. For example, the power supply for SD\_CLK is the VDD\_SDIO.
3. The operating temperature of the embedded flash in ESP32-D2WD ranges from  $-40^{\circ}C$  to  $105^{\circ}C$ , and so does that of ESP32-D2WD as a whole ( $-40^{\circ}C \sim 105^{\circ}C$ ). The other chips in this series have no embedded flash, and their range of operating temperatures is  $-40^{\circ}C \sim 125^{\circ}C$ .

### 5.2 RF Power-Consumption Specifications

The power consumption measurements are taken with a 3.0V supply at  $25^{\circ}C$  of ambient temperature, at the antenna port. All transmitters' measurements are based on a 50% duty cycle.

**Table 10: RF Power-Consumption Specifications**

Mode	Min	Typ	Max	Unit
Transmit 802.11b, DSSS 1 Mbps, POUT = +19.5 dBm	-	240	-	mA
Transmit 802.11b, OFDM 54 Mbps, POUT = +16 dBm	-	190	-	mA
Transmit 802.11g, OFDM MCS7, POUT = +14 dBm	-	180	-	mA
Receive 802.11b/g/n	-	95 ~ 100	-	mA
Transmit BT/BLE, POUT = 0 dBm	-	130	-	mA
Receive BT/BLE	-	95 ~ 100	-	mA

## 5.3 Wi-Fi Radio

**Table 11: Wi-Fi Radio Characteristics**

Description	Min	Typical	Max	Unit
Input frequency	2412	-	2484	MHz
Output impedance*	-	*	-	$\Omega$
Input reflection	-	-	-10	dB
Tx power				
Output power of PA for 72.2 Mbps	13	14	15	dBm
Output power of PA for 11b mode	19.5	20	20.5	dBm
Sensitivity				
DSSS, 1 Mbps	-	-98	-	dBm
CCK, 11 Mbps	-	-91	-	dBm
OFDM, 6 Mbps	-	-93	-	dBm
OFDM, 54 Mbps	-	-75	-	dBm
HT20, MCS0	-	-93	-	dBm
HT20, MCS7	-	-73	-	dBm
HT40, MCS0	-	-90	-	dBm
HT40, MCS7	-	-70	-	dBm
MCS32	-	-89	-	dBm
Adjacent channel rejection				
OFDM, 6 Mbps	-	37	-	dB
OFDM, 54 Mbps	-	21	-	dB
HT20, MCS0	-	37	-	dB
HT20, MCS7	-	20	-	dB

\*The typical value of ESP32's Wi-Fi radio output impedance is different in chips of different QFN packages. For ESP32 chips with QFN 6x6 package (ESP32-D0WDQ6), the value is  $30+j10 \Omega$ . For ESP32 chips with QFN 5x5 package (ESP32-D0WD, ESP32-D2WD, ESP32-S0WD), the value is  $35+j10 \Omega$ .

## 8. Learning Resources

### 8.1 Must-Read Documents

Click on the following links for related documents of ESP32.

- [ESP32 Technical Reference Manual](#)  
The manual provides detailed information on how to use the ESP32 memory and peripherals.
- [ESP32 Hardware Resources](#)  
The zip files include the schematics, PCB layout, Gerber and BOM list of ESP32-DevKitC.
- [ESP32 Hardware Design Guidelines](#)  
The guidelines outline recommended design practices when developing standalone or add-on systems based on the ESP32 series of products, including ESP32, the ESP-WROOM-32 module, and ESP32-DevKitC — the development board.
- [ESP32 AT Instruction Set and Examples](#)  
This document introduces the ESP32 AT commands, explains how to use them, and provides examples of several common AT commands.

### 8.2 Must-Have Resources

Here are the ESP32-related must-have resources.

- [ESP32 BBS](#)  
This is an Engineer-to-Engineer (E2E) Community for ESP32, where you can post questions, share knowledge, explore ideas, and solve problems together with fellow engineers.
- [ESP32 GitHub](#)  
ESP32 development projects are freely distributed under Espressif's MIT license on GitHub. It is established to help developers get started with ESP32, thus encouraging the growth of knowledge of ESP32-related hardware and software.
- [ESP32 Tools](#)  
This is a webpage from which users can download ESP32 Flash Download Tools and the zip file "ESP32 Certification and Test".
- [ESP-IDF](#)  
This webpage links users to the official IoT development framework for ESP32.
- [ESP32 Resources](#)  
This webpage provides the links to all the available ESP32 documents, SDK and tools.

## Appendix A – ESP32 Pin Lists

### A.1. Notes on ESP32 Pin Lists

Table 19: Notes on ESP32 Pin Lists

No.	Description
1	In Table <a href="#">IO_MUX</a> , the boxes highlighted in red show the differences from ESP31B. The boxes highlighted in blue indicate the new features of ESP32, compared to those of ESP31B. The boxes highlighted in yellow indicate the GPIO pins that are input-only. Please see the following note for further details.
2	GPIO pins 34-39 are input-only. These pins do not feature an output driver or internal pull-up/pull-down circuitry. The pin names are: SENSOR_VP (GPIO36), SENSOR_CAPP (GPIO37), SENSOR_CAPN (GPIO38), SENSOR_VN (GPIO39), VDET_1 (GPIO34), VDET_2 (GPIO35).
3	The pins are grouped into four power domains: VANA (analog power supply), VRTC (RTC power supply), VIO (power supply of digital IOs and CPU cores), VSDIO (power supply of SDIO IOs). VSDIO is the output of the internal SDIO-LDO. The voltage of SDIO-LDO can be configured at 1.8V or the same as that of the VRTC. The strapping pin and eFuse bits determine the default voltage of the SDIO-LDO. Software can change the voltage of the SDIO-LDO by configuring register bits. For details, please see the column “Power Domain” in Table <a href="#">IO_MUX</a> .
4	The functional pins in the VRTC domain are those with analog functions, including the 32 kHz crystal oscillator, ADC pre-amplifier, ADC, DAC, and capacitive touch sensor. Please see columns “Analog Function 1~3” in Table <a href="#">IO_MUX</a> .
5	These VRTC pins support the RTC function, and can work during Deep-sleep. For example, an RTC-GPIO can be used for waking up the chip from Deep-sleep.
6	The GPIO pins support up to six digital functions, as shown in columns “Function 1~6” In Table <a href="#">IO_MUX</a> . The function selection registers will be set as “N-1”, where N is the function number. Below are some definitions: <ul style="list-style-type: none"> <li>• SD_* is for signals of the SDIO slave.</li> <li>• HS1_* is for Port 1 signals of the SDIO host.</li> <li>• HS2_* is for Port 2 signals of the SDIO host.</li> <li>• MT* is for signals of the JTAG.</li> <li>• U0* is for signals of the UART0 module.</li> <li>• U1* is for signals of the UART1 module.</li> <li>• U2* is for signals of the UART2 module.</li> <li>• SPI* is for signals of the SPI01 module.</li> <li>• HSPI* is for signals of the SPI2 module.</li> <li>• VSPI* is for signals of the SPI3 module.</li> </ul>

No.	Description
7	<p>Each digital “Function” column is accompanied by a column of “Type”. Please see the following explanations for the meaning of “type” with respect to each “function” it is associated with. For any “Function-<i>N</i>”, “type” signifies:</p> <ul style="list-style-type: none"> <li>• I: input only. If a function other than “Function-<i>N</i>” is assigned, the input signal of “Function-<i>N</i>” is still from this pin.</li> <li>• I1: input only. If a function other than “Function-<i>N</i>” is assigned, the input signal for “Function-<i>N</i>” is always “1”.</li> <li>• I0: input only. If a function other than “Function-<i>N</i>” is assigned, the input signal for “Function-<i>N</i>” is always “0”.</li> <li>• O: output only.</li> <li>• T: high-impedance.</li> <li>• I/O/T: combinations of input, output, and high-impedance according to the function signal.</li> <li>• I1/O/T: combinations of input, output, and high-impedance according to the function signal. If a function is not selected, the input signal of the function is “1”.</li> </ul> <p>For example, pin 30 can act as HS1_CMD or SD_CMD, where HS1_CMD is of an “I1/O/T” type. If pin 30 is selected as HS1_CMD, the input and output of this pin are controlled by the SDIO host. If pin 30 is not selected as HS1_CMD, the input signal to SDIO host is always “1”.</p>
8	<p>Each digital output pin is associated with its configurable drive-strength. Column “Drive Strength” in Table <a href="#">IO_MUX</a> lists the default values. The drive strength of the digital output pins can be configured into one of the following four options:</p> <ul style="list-style-type: none"> <li>• 0: ~5 mA</li> <li>• 1: ~10 mA</li> <li>• 2: ~20 mA</li> <li>• 3: ~40 mA</li> </ul> <p>The default value is 2. The drive strength of the internal pull-up (wpu) and pull-down (wpd) is ~75 <math>\mu</math>A.</p>
9	<p>Column “At Reset” in Table <a href="#">IO_MUX</a> lists the status of each pin during reset, including input-enable (ie=1), internal pull-up (wpu) and internal pull-down (wpd). During reset, all pins are output-disabled.</p>
10	<p>Column “After Reset” in Table <a href="#">IO_MUX</a> lists the status of each pin immediately after reset, including input-enable (ie=1), internal pull-up (wpu) and internal pull-down (wpd). After reset, each pin is set to its “Function 1”. The output-enable is controlled by its digital Function 1.</p>
11	<p>Table <a href="#">Ethernet_MAC</a> is about the signal mapping inside Ethernet MAC. The Ethernet MAC supports MII and RMII interfaces, and supports both internal PLL clock and the external clock source. For MII interface, the Ethernet MAC is with/without the TX_ERR signal. MDC, MDIO, CRS and COL are slow signals, and can be mapped onto any GPIO pins through the GPIO-Matrix.</p>
12	<p>Table <a href="#">GPIO Matrix</a> is for the GPIO-Matrix. The signals of the on-chip functional modules can be mapped onto any GPIO pins. Some signals can be mapped onto a pin by both IO-MUX and GPIO-Matrix, as shown in the column tagged as “Same input signal from IO_MUX core” in Table <a href="#">GPIO Matrix</a>.</p>

No.	Description
13	*In Table <a href="#">GPIO_Matrix</a> the column “Default Value if unassigned” records the default value of the an input signal if no GPIO is assigned to it. The actual value is determined by register GPIO_FUNC $m$ _IN_INV_SEL and GPIO_FUNC $m$ _IN_SEL. (The value of $m$ ranges from 1 to 255.)
